

Making a New SD Card with RFD or UBIQUITY OS Image

RFD/UBIQUITI Image

- You have one image file that can be used with both Ubiquiti (video payload) and RFD with some modification with a Pi. You have a backup
- **IT IS RECOMMENDED THAT YOU BACK UP THIS IMAGE FILE.** (Note, these files are almost 8GB each, therefore devices formatted with FAT32 will not be able to store these files. A device formatted NTFS is recommended for storage of these image files.)
- Here you will learn how to create a new image from an OS already on a SD card or how to put an image onto a new SD card for use with the video or still image payloads.

Making a New Image: Reading from SD card with OS already installed

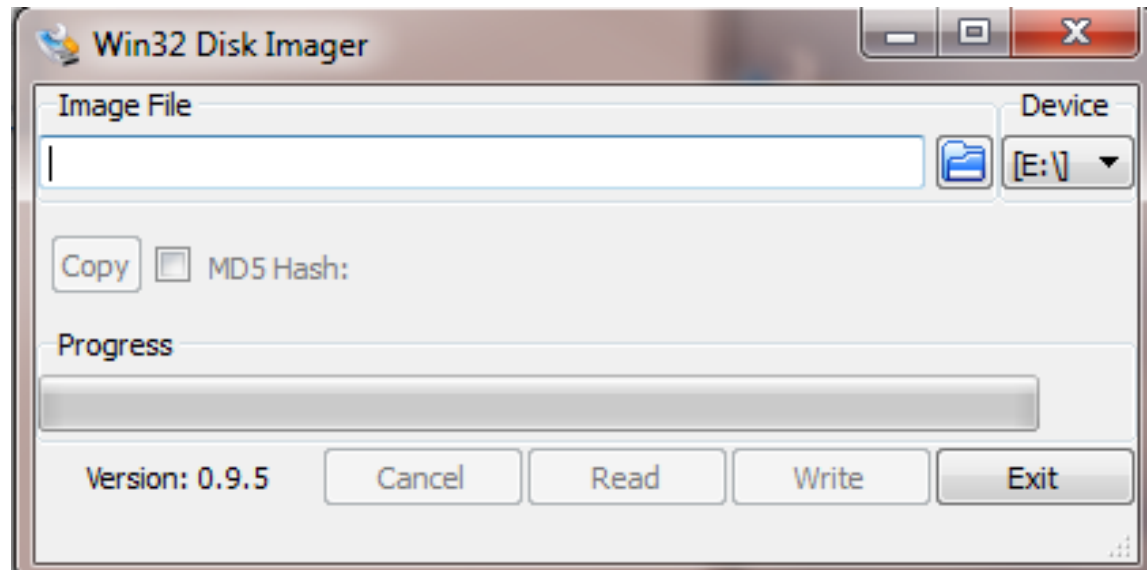

- You will need to use Win32DiskImager to create an image file (read) or put an image file on SD card (write)
- We will begin by creating a new image file from an SD card with an OS already set up. Typically you will write images to SD cards, but it is important that you know how to read an image from an SD in case something happened to your ground station laptop.

Making a New Image: Reading from SD card with OS already installed

Open Win32DiskImager

You will see the following window:

Making a New Image: Reading from SD card with OS already installed

Open Win32DiskImager

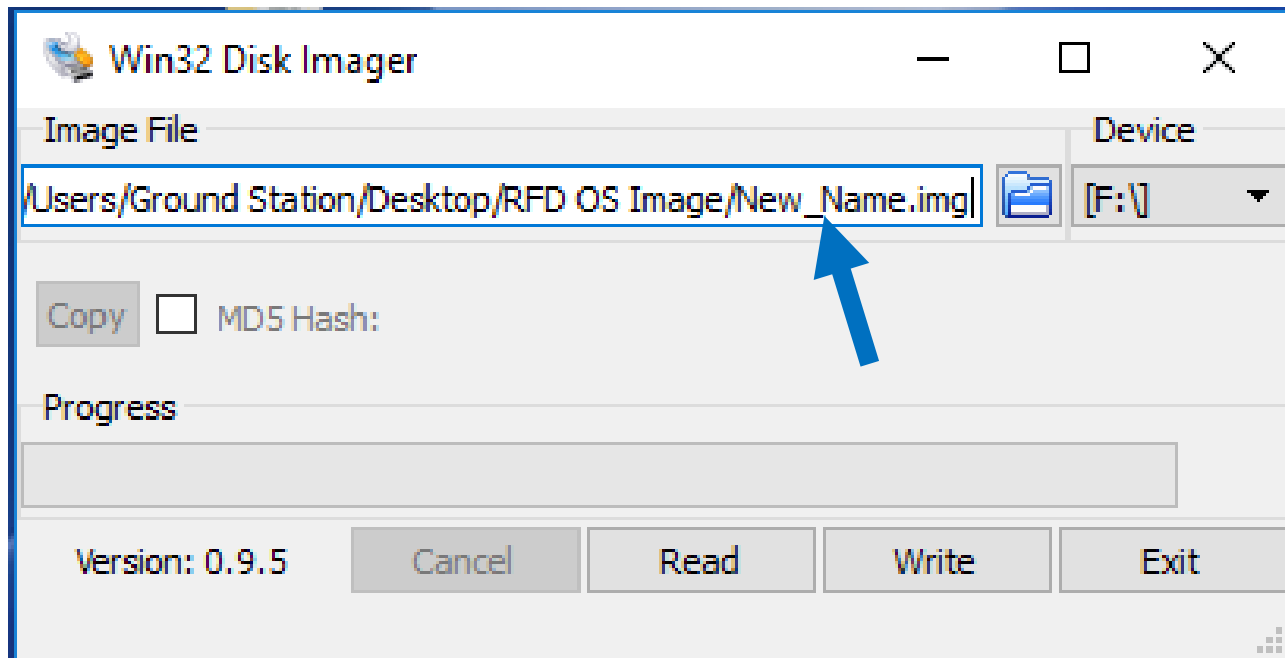

You will see the following window:

Making a New Image: Reading from SD card with OS already installed

Write in the path where you would like to store the image file.

In this example, we are creating an image in a folder titled “RFD OS Image” located on the ground station laptop desktop. The name of this image will be **New_Name.img**. Naming convention of which OS is being imaged (RFD or UBIQUITI) and date/version number will help you keep track of changes. NOTE: YOU MUST TYPE **.img** AFTER THE NAME AND DO NOT USE SPACES.

Making a New Image: Reading from SD card with OS already installed

Make sure you are reading from the correct **Device** (**F:** in this example, yours may differ). If you need to check which device your SD card is go to **Computer** to see your connected drives. Once you have the correct device selected, simply click the **Read** button. It may take about 5-10 minutes for the image to be created. This image can now be used to create a new SD card to run that particular OS

Getting a New SD card set up: Writing image to SD card so it can be used with flight payload

The process is very similar to write an image onto an SD card to prepare it for use with one of the flight payloads. In this example, we will write the RFD OS onto a new SD card. To begin, find the image file you wish to put on the SD card. In this example, we will put the RFD operating system on a new 64GB SD card. You can write in the path to the image file or browse for it by clicking [here](#).

Getting a New SD card set up: Writing image to SD card so it can be used with flight payload

In this example, the image file is located on the desktop of the ground station laptop in the folder **RFD OS Image** and the image file is **RFD_OS.img**

Select the **Device** you are writing the image to (the new SD Card). In this example the device is **F:** although yours may vary.

Getting a New SD card set up: Writing image to SD card so it can be used with flight payload

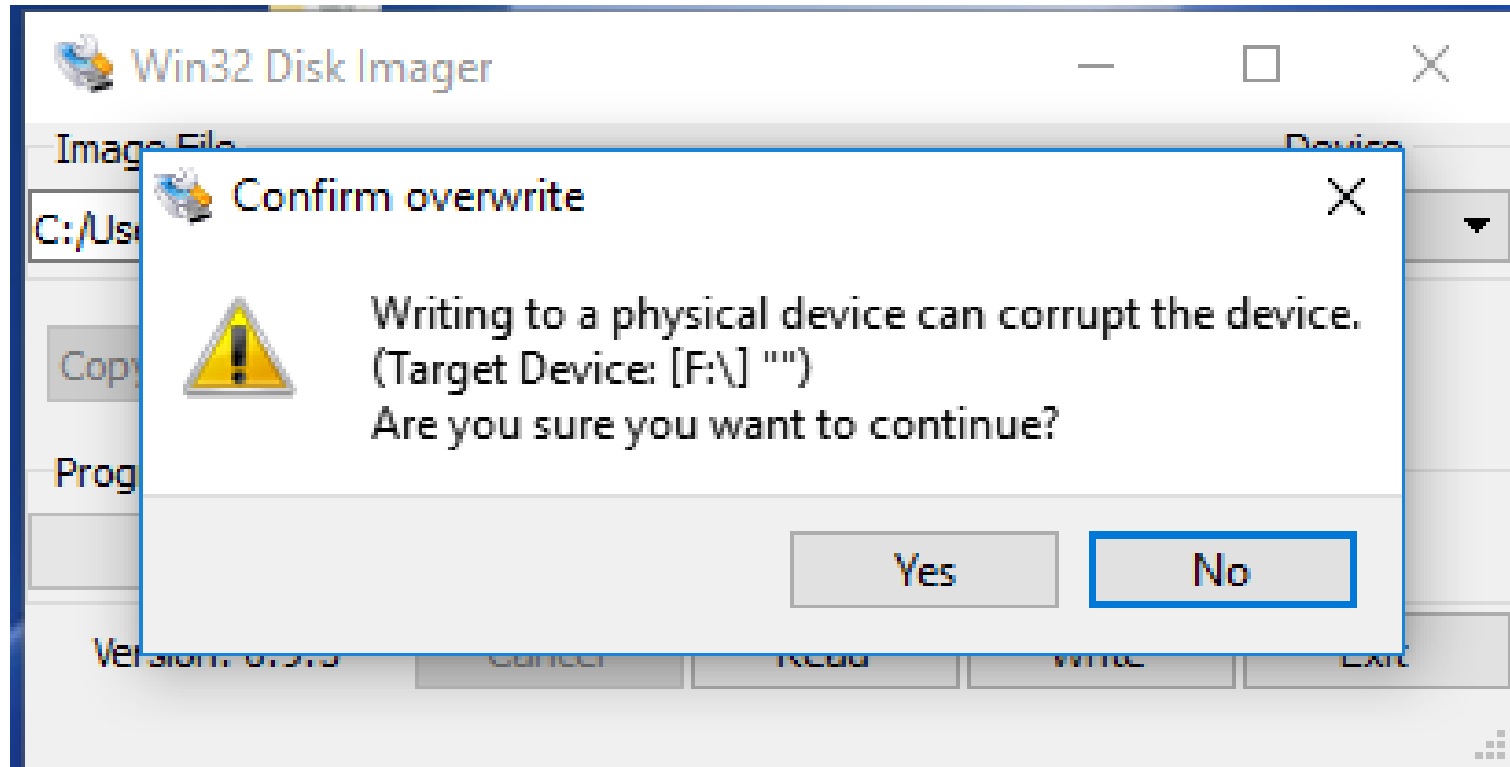

In this example, the image file is located on the desktop of the ground station laptop in the folder **RFD OS Image** and the image file is **RFD_OS.img**

Once you have your image file selected, simply click **Write**

Getting a New SD card set up: Writing image to SD card so it can be used with flight payload

The following warning will be displayed. Click **YES**.

Getting a New SD card set up: Writing image to SD card so it can be used with flight payload

Your image will now be written to the card. This may take a while.

Getting a New SD card set up: Writing image to SD card so it can be used with flight payload

Once completed, you have one final step to take to prepare the card for Pi operation, you must expand the filesystem. To do so, insert the new card into a pi and connect Pi as a computer (See using pi as computer) or wirelessly access pi (see instructions).

Expanding a Newly Imaged SD Card

- If you put an image of the RFD or UBIQUITI OS on a new SD card, you must expand the card to allow the Pi full access to the “free space” on the card for storage, etc.
- To see how to make a new image, see the “Making new SD card with RFD or UBIQUITI OS” instructions
- Begin by inserting the card into a UNPOWERED pi SD card slot and powering up the pi.
- Login to the pi

Expanding your SD Card: Login to your Pi

```
[ OK ] Starting system message bus: dbus.
[ ok ] Starting OpenBSD Secure Shell server: sshd.
hwclock: Cannot access the Hardware Clock via any known method.
hwclock: Use the --debug option to see the details of our search for an access

Raspbian GNU/Linux 7 Raspberry tty1

Raspberry login: pi
Password:
Login timed out after 60 seconds.

Raspbian GNU/Linux 7 Raspberry tty1

Raspberry login: pi
Password:
Last login: Thu May 5 01:36:08 UTC 2016 on tty1
Linux Raspberry 3.18.7-v7+ #755 SMP PREEMPT Thu Feb 12 17:20:48 GMT 2015 armv7l

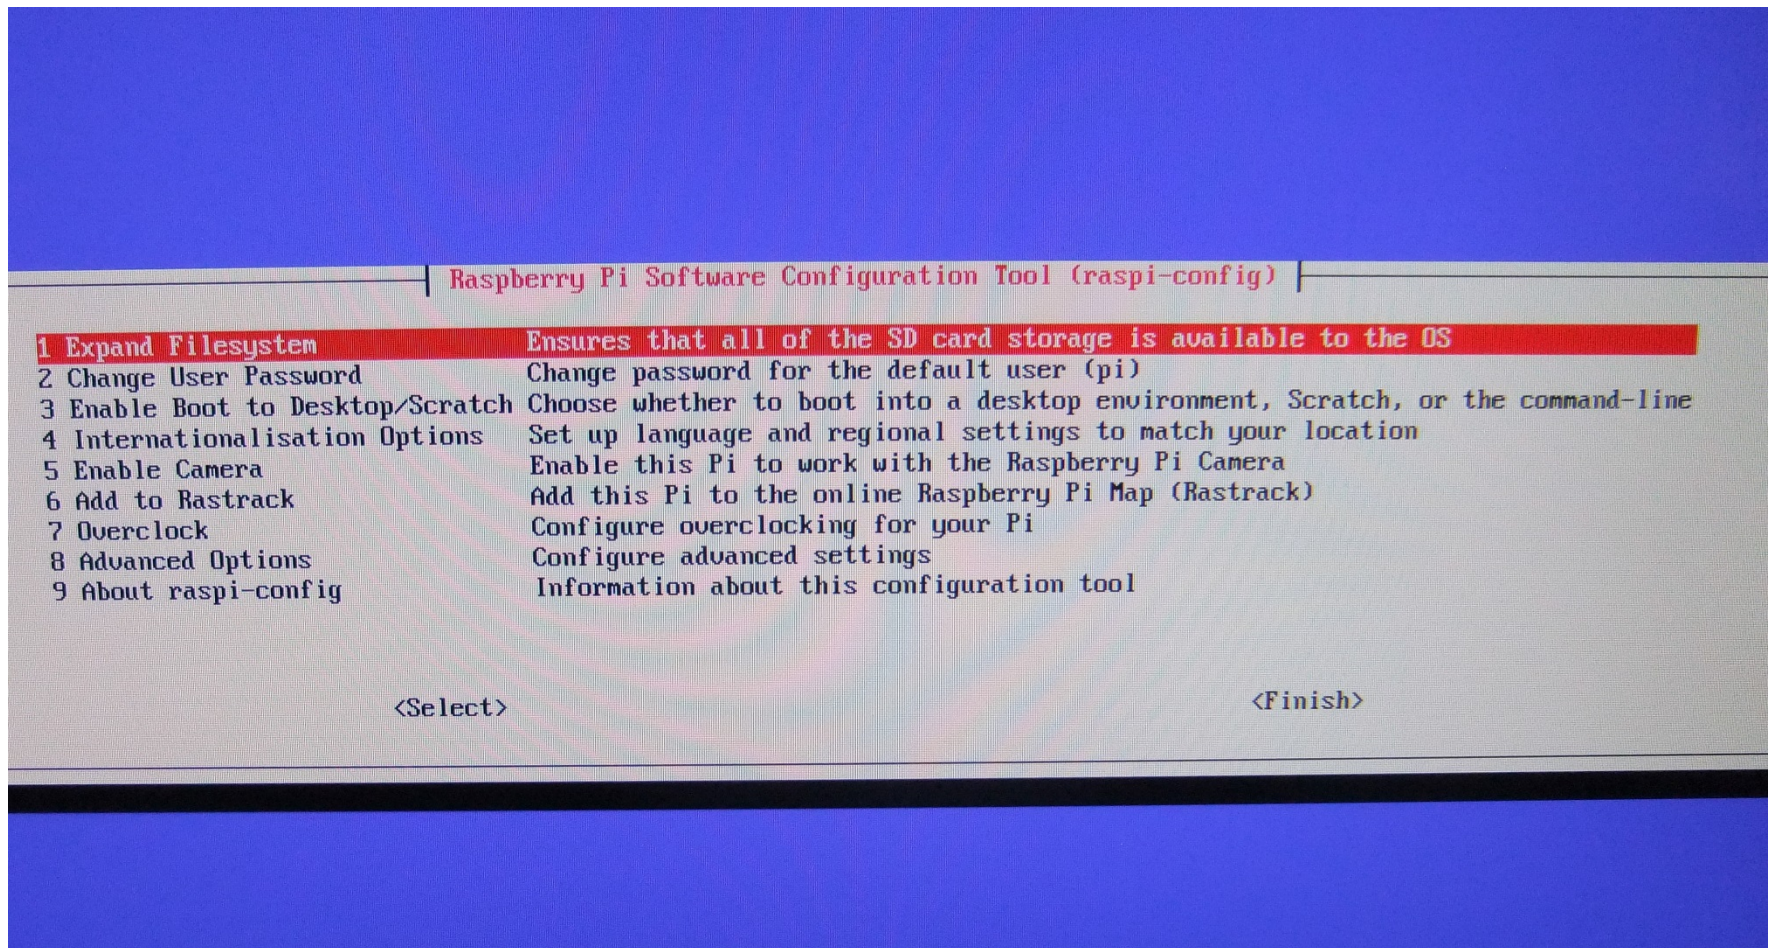

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
pi@Raspberry ~ $ sudo raspi-config
```

Once logged into the Pi type **sudo raspi-config** and hit **[ENTER]**

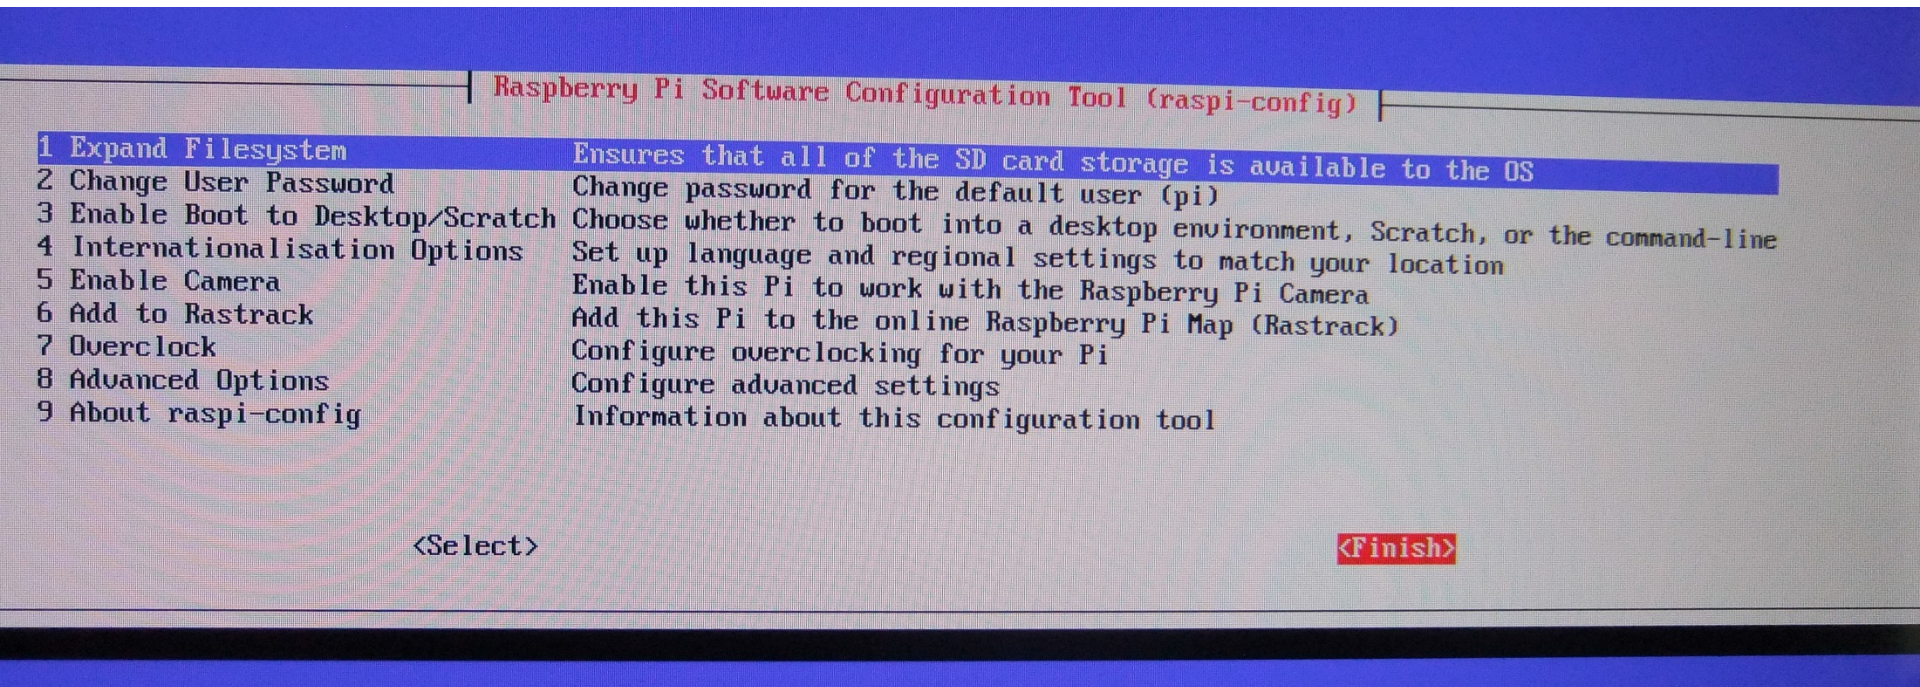

Expanding your SD Card: Login to your Pi

The following screen will be displayed. Highlight **1 Expand Filesystem** and hit [ENTER]

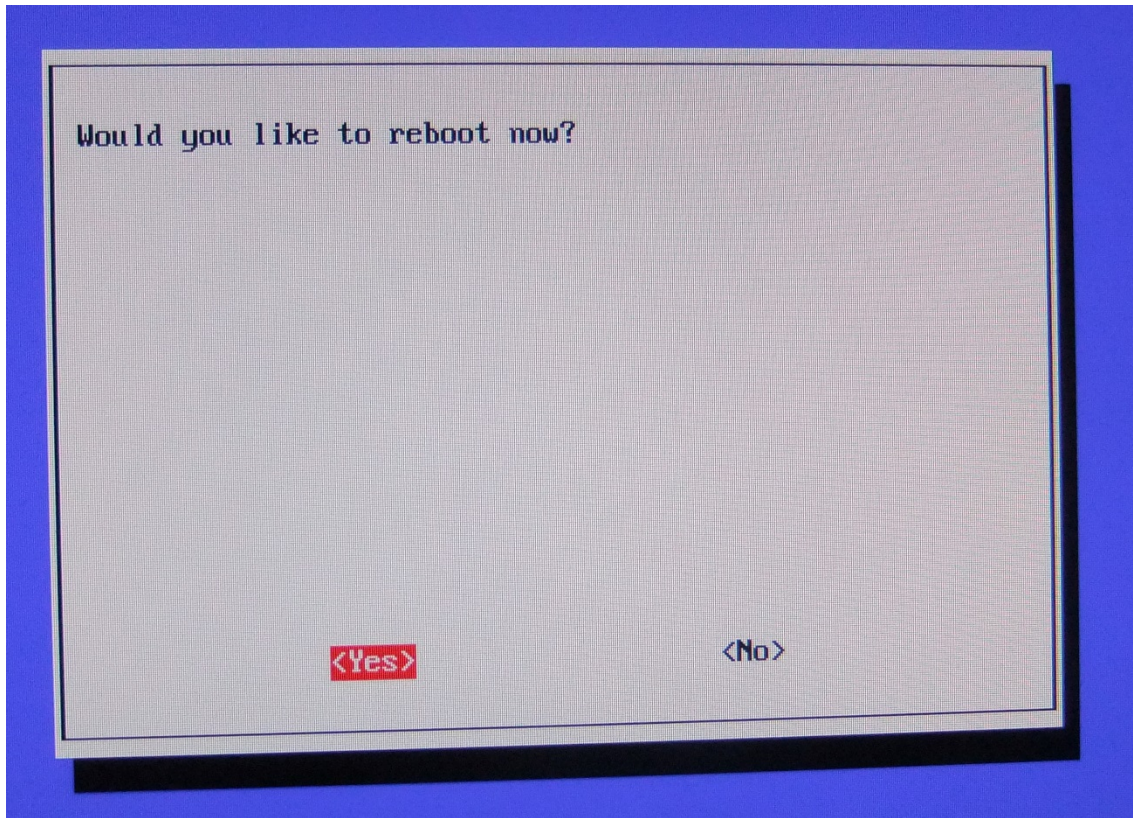

Expanding your SD Card: Login to your Pi

Use the **[Right Arrow Key]** or **[TAB]** to highlight **Finish** on the bottom and hit **[ENTER]**

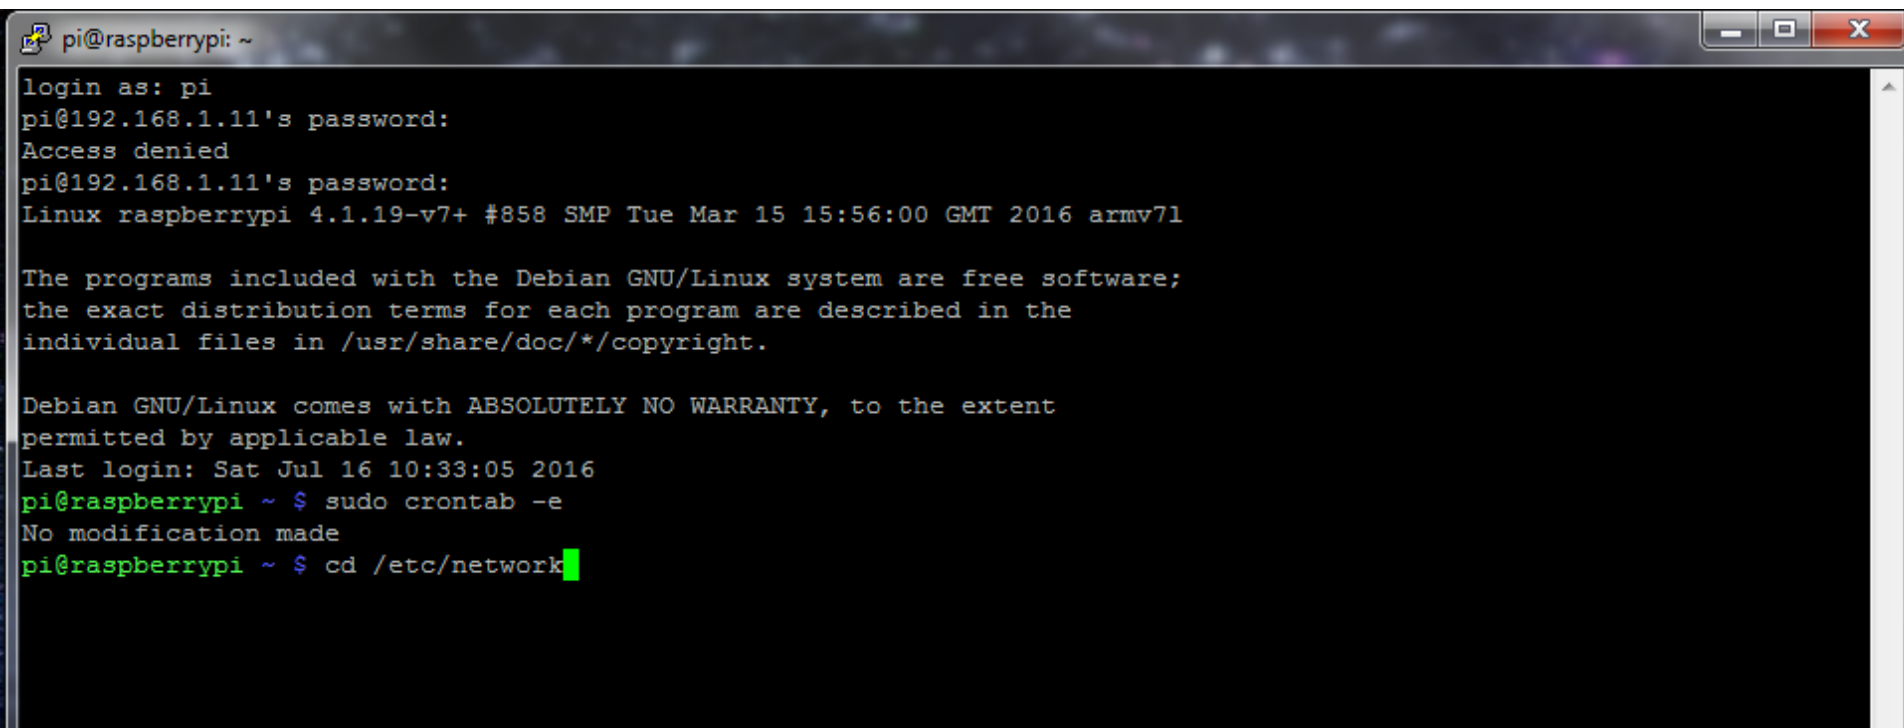

Expanding your SD Card: Login to your Pi

You will then be asked if you want to reboot, highlight **Yes** and hit **[ENTER]**

Your Pi will now reboot and bring you back to the “Login” screen. You have successfully expanded the filesystem. If you are done accessing the Pi, don’t forget to log back in and shutdown the Pi! (**sudo shutdown -h now**)

Making the SD card Ubiquiti Ready: Change Network Settings

A terminal window titled 'pi@raspberrypi: ~' with standard window controls. The terminal output shows a login attempt for user 'pi' at IP '192.168.1.11' which is denied. The system boot information is displayed, including the kernel version '4.1.19-v7+' and date 'Tue Mar 15 15:56:00 GMT 2016'. A copyright notice for Debian GNU/Linux is shown. The user then runs 'sudo crontab -e' and 'cd /etc/network'.

```
pi@raspberrypi: ~
login as: pi
pi@192.168.1.11's password:
Access denied
pi@192.168.1.11's password:
Linux raspberrypi 4.1.19-v7+ #858 SMP Tue Mar 15 15:56:00 GMT 2016 armv7l

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Sat Jul 16 10:33:05 2016
pi@raspberrypi ~ $ sudo crontab -e
No modification made
pi@raspberrypi ~ $ cd /etc/network
```

Go to networks directory: type **cd /etc/network** and hit **[ENTER]**

Making the SD card Ubiquiti Ready: Change Network Settings

```
pi@raspberrypi: /etc/network
login as: pi
pi@192.168.1.11's password:
Access denied
pi@192.168.1.11's password:
Linux raspberrypi 4.1.19-v7+ #858 SMP Tue Mar 15 15:56:00 GMT 2016 armv7l

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Sat Jul 16 10:33:05 2016
pi@raspberrypi ~ $ sudo crontab -e
No modification made
pi@raspberrypi ~ $ cd /etc/network
pi@raspberrypi /etc/network $ ls
if-down.d      if-pre-up.d  interfaces    interfaces.org interfaces.ubiquiti
if-post-down.d if-up.d      interfaces.dpkg-old interfaces.rfd  run
pi@raspberrypi /etc/network $ █
```

Type **ls** and hit **[ENTER]** to see directory contents. We want **interfaces.ubiquiti** to be copied into the **interfaces** directory

Making the SD card Ubiquiti Ready: Change Network Settings

```
pi@raspberrypi: /etc/network
login as: pi
pi@192.168.1.11's password:
Access denied
pi@192.168.1.11's password:
Linux raspberrypi 4.1.19-v7+ #858 SMP Tue Mar 15 15:56:00 GMT 2016 armv7l

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Sat Jul 16 10:33:05 2016
pi@raspberrypi ~ $ sudo crontab -e
No modification made
pi@raspberrypi ~ $ cd /etc/network
pi@raspberrypi /etc/network $ ls
if-down.d      if-pre-up.d  interfaces    interfaces.org interfaces.ubiquiti
if-post-down.d if-up.d      interfaces.dpkg-old interfaces.rfd  run
pi@raspberrypi /etc/network $ sudo cp interfaces.ubiquiti interfaces
```

Copy the file `interfaces.ubiquiti` file to `interfaces` directory by typing: `sudo cp interfaces.ubiquiti interfaces` and hit [ENTER]

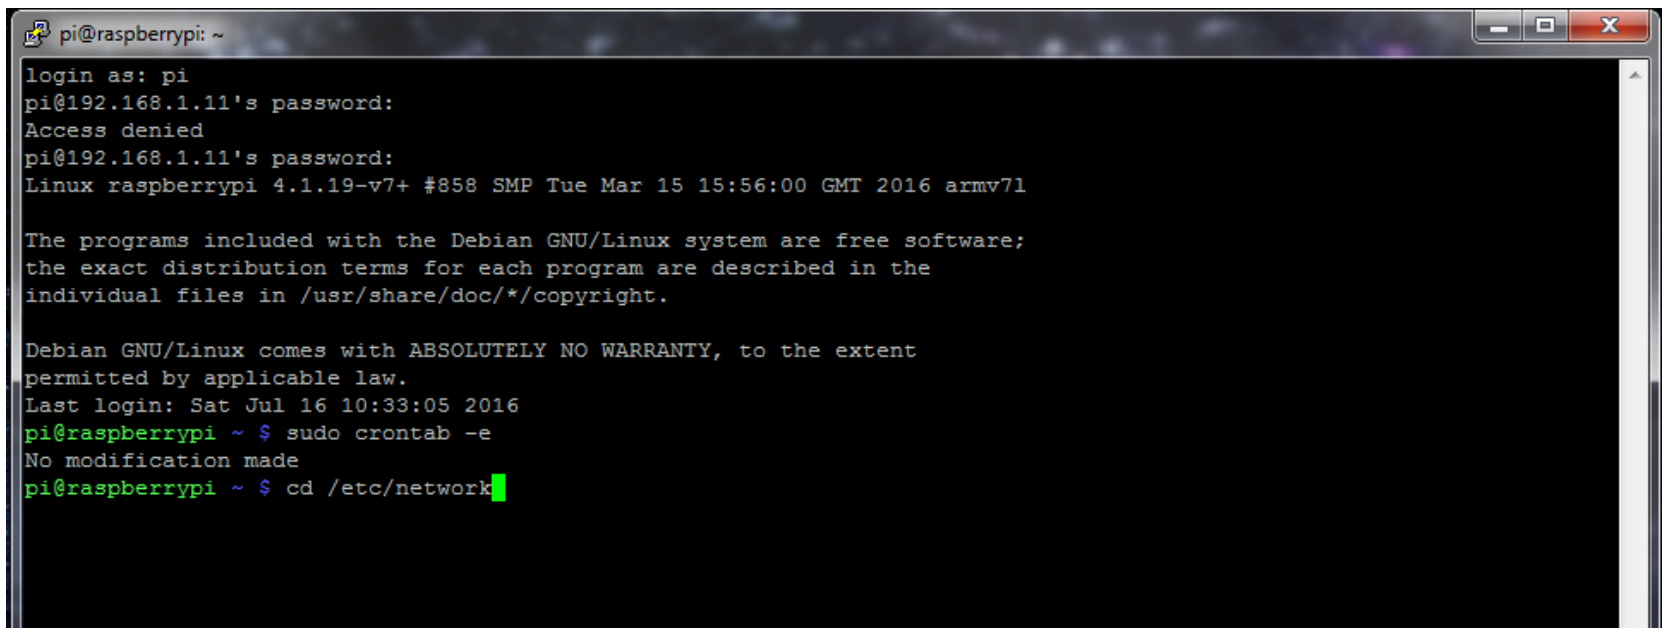

Now reboot the Pi (`sudo reboot`)

Making the SD card Ubiquiti Ready

- CARD IS READY FOR UBIQUITI!
- DON'T FORGET TO SHUTDOWN THE PI

`sudo shutdown -h now`

Making the SD card RFD Ready: Change Network Settings

A terminal window titled 'pi@raspberrypi: ~' with standard window controls. The terminal output shows a login attempt for user 'pi' at IP '192.168.1.11' which is denied. The system version is 'Linux raspberrypi 4.1.19-v7+ #858 SMP Tue Mar 15 15:56:00 GMT 2016 armv7l'. It displays the Debian GNU/Linux license notice and the last login time 'Sat Jul 16 10:33:05 2016'. The user then runs 'sudo crontab -e' and 'cd /etc/network', with the latter command being partially visible and highlighted in green.

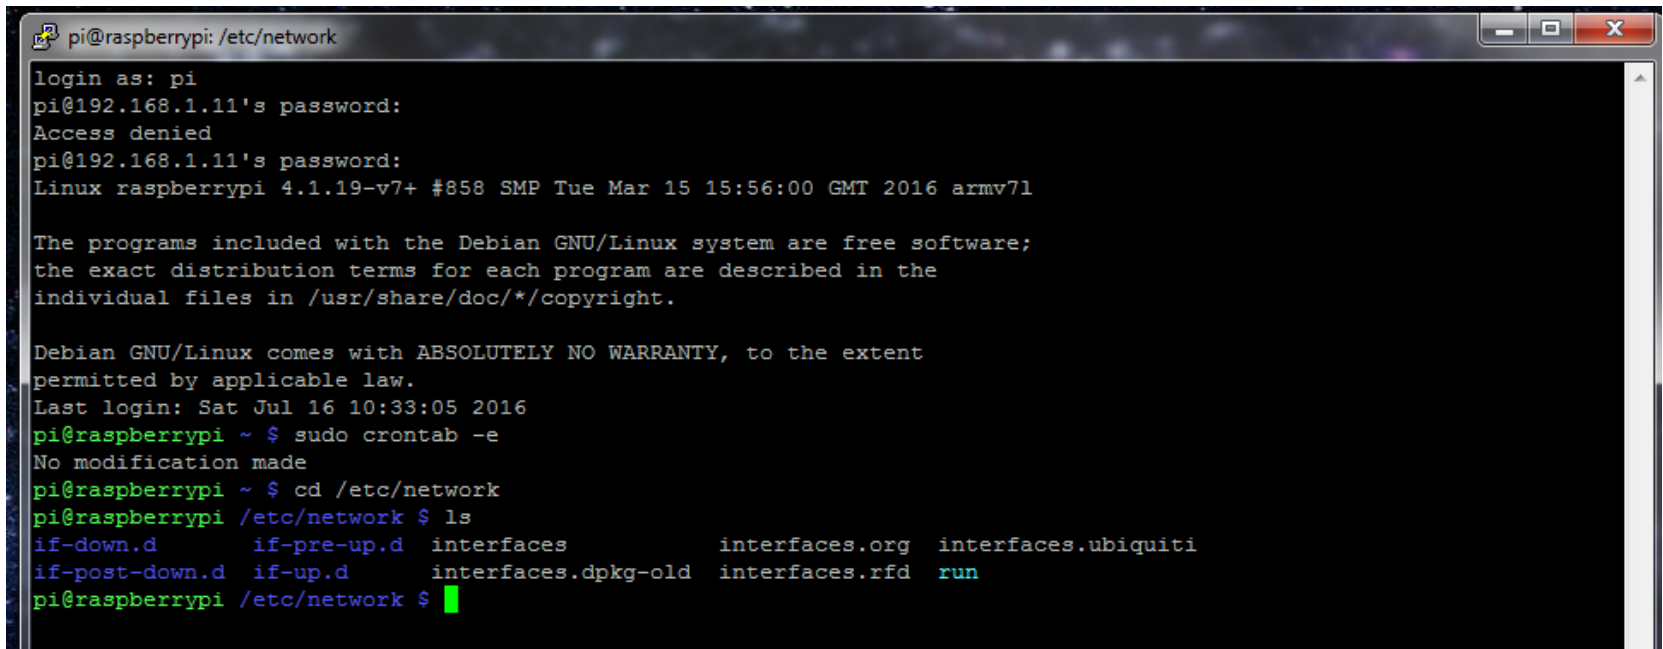

```
pi@raspberrypi: ~
login as: pi
pi@192.168.1.11's password:
Access denied
pi@192.168.1.11's password:
Linux raspberrypi 4.1.19-v7+ #858 SMP Tue Mar 15 15:56:00 GMT 2016 armv7l

pi@raspberrypi ~ $ sudo crontab -e
No modification made
pi@raspberrypi ~ $ cd /etc/network
pi@raspberrypi /etc/network $ ls
if-down.d      if-pre-up.d  interfaces    interfaces.org  interfaces.ubiquiti
if-post-down.d if-up.d      interfaces.dpkg-old  interfaces.rfd  run
pi@raspberrypi /etc/network $ sudo cp interfaces.rfd interfaces
```

**Copy the file interfaces.rfd file to interfaces directory by typing:
sudo cp interfaces.ubiquiti interfaces and hit [ENTER]**

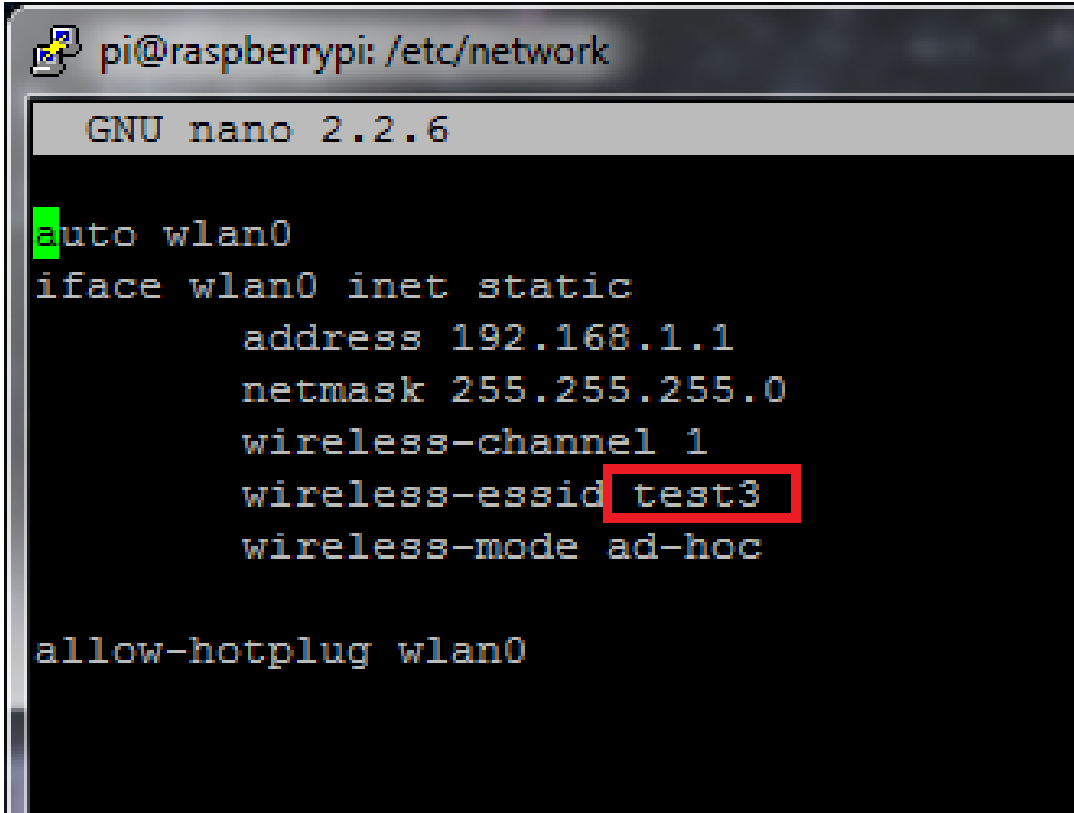

Making the SD card RFD Ready: Change Network Settings

- IF YOU ARE STARTING FROM NEW IMAGE – NEED TO CHANGE NETWORK NAME (ESSID)

From networks folder
(/etc/network) type: `sudo nano`
interfaces

Change ESSID to your workshop
registration number (so you can
connect ground station computer to
Pi in the field. This will allow you to
shut pi down in the field properly to
avoid corrupting SD cards).

Ctrl + O to save and Ctrl + X to exit

A terminal window titled 'pi@raspberrypi: /etc/network' showing the nano 2.2.6 editor. The editor displays network configuration for wlan0. The text is as follows:

```
auto wlan0
iface wlan0 inet static
    address 192.168.1.1
    netmask 255.255.255.0
    wireless-channel 1
    wireless-ssid test3
    wireless-mode ad-hoc

allow-hotplug wlan0
```

The word 'test3' in the 'wireless-ssid' line is highlighted with a red rectangular box.

Making the SD card RFD Ready: Changing crontab to start RFD Prog

```
pi@raspberrypi: ~  
login as: pi  
pi@192.168.1.11's password:  
Access denied  
pi@192.168.1.11's password:  
Linux raspberrypi 4.1.19-v7+ #858 SMP Tue Mar 15 15:56:00 GMT 2016 armv7l

permitted by applicable law.  
Last login: Sat Jul 16 10:33:05 2016  
pi@raspberrypi ~ $ sudo crontab -e
```

Edit the crontab from the pi “home” Directory: type **sudo crontab -e** and hit **[ENTER]**

Making the SD card RFD Ready: Changing crontab to start RFD Prog

```
pi@raspberrypi: ~
GNU nano 2.2.6 File: /tmp/crontab.VEvCcs/crontab
# Edit this file to introduce tasks to be run by cron.
#
# Each task to run has to be defined through a single line
# indicating with different fields when the task will be run
# and what command to run for the task
#
# To define the time you can provide concrete values for
# minute (m), hour (h), day of month (dom), month (mon),
# and day of week (dow) or use '*' in these fields (for 'any').#
# Notice that tasks will be started based on the cron's system
# daemon's notion of time and timezones.
#
# Output of the crontab jobs (including errors) is sent through
# email to the user the crontab file belongs to (unless redirected).
#
# For example, you can run a backup of all your user accounts
# at 5 a.m every week with:
# 0 5 * * 1 tar -zcf /var/backups/home.tgz /home/
#
# For more information see the manual pages of crontab(5) and cron(8)
#
# m h dom mon dow command
@reboot cd /home/pi/RFD_Payload; sudo python /home/pi/RFD_Payload/RFD_python_Pi.py &
```

DELETE THE HASHTAG (#) HIGHLIGHTED IN GREEN ABOVE

Making the SD card RFD Ready: Changing crontab to start RFD Prog

```
pi@raspberrypi: ~
